Table 22.1 Sex- and Gender-Related Factors That Contribute to Differences in the Epidemiology of Kidney Disease in Men and Women (Continued)			
Difference	Sex-Related Factors	Gender-Related Factors	Refs.
Women experience more adverse drug events than men	Differences in the pharmacokinetics and pharmacodynamics of medications	Women are more likely to be prescribed potentially inappropriate nephrotoxic medications Women are often prescribed higher doses in relation to their body weight	109-113
ACR, Albumin-to-creatinine ratio; CKD, chronic kidney disease; eGFR, estimated glomerular filtration rate; KRT, kidney replacement therapy. Adapted with permission from ref. ³

Table 22.1 Sex- and Gender-Related Factors That Contribute to Differences in the Epidemiology of Kidney Disease in Men and Women			
Difference	Sex-Related Factors	Gender-Related Factors	Refs.
Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease	On average, men have more comorbidities (hypertension, diabetes, hyperlipidemia, and heart failure) than women. Men have higher rates of smoking, alcohol use, and occupational exposure to nephrotoxic agents. Men have a higher prevalence of diabetes mellitus and hypertension. Men have a higher prevalence of cardiovascular disease and are more likely to be treated with nephrotoxic medications. Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease.	Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease. Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease. Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease.	20,21-23
Men experience faster loss of renal function	Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease. Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease. Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease.	Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease. Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease. Men have a higher prevalence of chronic kidney disease and faster progression to end-stage kidney disease.	24-26,27,28-30
The prevalence of CKD is higher in men than in women	Lower mean body surface area (BSA) in men than in women. Higher rates of smoking, alcohol use, and occupational exposure to nephrotoxic agents in men. Higher rates of comorbidities (hypertension, diabetes, hyperlipidemia, and heart failure) in men. Higher rates of chronic kidney disease and faster progression to end-stage kidney disease in men.	Higher rates of chronic kidney disease and faster progression to end-stage kidney disease in men.
